Energy Insecurity in Redlined America

AERE 2021

A. Justin Kirkpatrick Michigan State University June 2021

Generous funding provided by the Nicholas Institute at Duke Most recent web-based slides here

The disproportionate share of household income allocated to energy expenses with those that exceed a 10% threshold categorized as experiencing "energy insecurity." (Hernández 2015)

- Drehobl and Ross (2016) find 75th percentile energy burdens above 26%.
- Lyubich (2020) finds minority households spend more on energy
- Doremus et al (2021) finds low-income households use more energy during weather extremes

The disproportionate share of household income allocated to energy expenses with those that exceed a 10% threshold categorized as experiencing "energy insecurity." (Hernández 2015)

- Drehobl and Ross (2016) find 75th percentile energy burdens above 26%.
- Lyubich (2020) finds minority households spend more on energy
- Doremus et al (2021) finds low-income households use more energy during weather extremes

Energy Inequity

- Reames (2016): Minority-dominated census block-groups tend to have lower (worse) energy efficiency and spend a greater total amount for the same level of energy services relative to non-minority households.
- Drehobl and Ross (2016) using ACS data: Black and Hispanic households face higher median energy burdens, even conditional on income.

The disproportionate share of household income allocated to energy expenses with those that exceed a 10% threshold categorized as experiencing "energy insecurity." (Hernández 2015)

- Drehobl and Ross (2016) find 75th percentile energy burdens above 26%.
- Lyubich (2020) finds minority households spend more on energy
- Doremus et al (2021) finds low-income households use more energy during weather extremes

Energy Inequity

- Reames (2016): Minority-dominated census block-groups tend to have lower (worse) energy efficiency and spend a greater total amount for the same level of energy services relative to non-minority households.
- Drehobl and Ross (2016) using ACS data: Black and Hispanic households face higher median energy burdens, even conditional on income.

Energy Inequity: "The disproportionate incidence of energy insecurity in heavily-minority areas relative to non-minority areas of similar income."

Why?

- Preferences & Sorting?
 - Lower-efficiency homes are less expensive, income constraints → "coming to the nuisance" (Banzhaf, 2011; Depro et al, 2015)
 - But conditional on income, do minority households prefer lower efficiency?
 - Lower utility of heating? Lower utility of non-energy consumption?

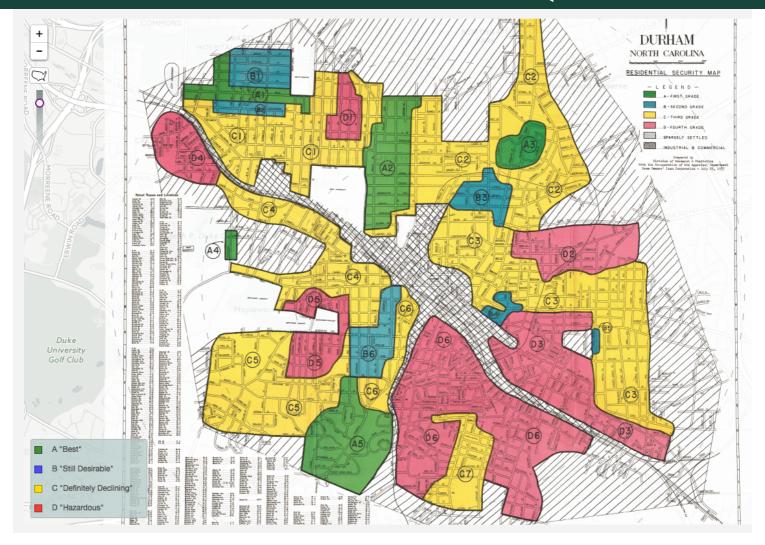

Why?

- Preferences & Sorting?
 - Lower-efficiency homes are less expensive, income constraints → "coming to the nuisance" (Banzhaf, 2011; Depro et al, 2015)
 - But conditional on income, do minority households prefer lower efficiency?
 - Lower utility of heating? Lower utility of non-energy consumption?
- Current housing discrimination or heterogeneous information?
 - Christensen et al (2020): Rental agents steer minority households away from low-toxic exposure properties
 - Missing information disproportionately affects those sorting to the lower quality homes (Bakkensen and Ma, 2020; Hausman and Stolper, 2020)

Why?

- Preferences & Sorting?
 - Lower-efficiency homes are less expensive, income constraints → "coming to the nuisance" (Banzhaf, 2011; Depro et al, 2015)
 - But conditional on income, do minority households prefer lower efficiency?
 - Lower utility of heating? Lower utility of non-energy consumption?
- Current housing discrimination or heterogeneous information?
 - Christensen et al (2020): Rental agents steer minority households away from low-toxic exposure properties
 - Missing information disproportionately affects those sorting to the lower quality homes (Bakkensen and Ma, 2020; Hausman and Stolper, 2020)
- State dependence / hysteresis
 - Historic forms of discrimination
 - Frictions in moving costs

Durham, NC Redlining Map (source: URichmond Mapping Inequality)

Homeowners Loan Corporation (HOLC)

- New Deal agency tasked with assessing mortgage risk for federal refinancing efforts
- Neighborhoods risk-graded by local agents 1933-1939
- Largely considered "subversive minorities" to be harbinger of decline and risk.
- Widespread discrimination in housing via discriminatory lending

₀: Energy Inequity is in part the result of a *hysteresis* effect rooted in historic housing discrimination.

Redlining was a "critical juncture" that separated otherwise similar housing stock.

- Test by examining differences in home energy services quality between redlined and observably similar non-redlined households, measured as the
 - (1) presence of sufficient heating technology and
 - (2) energy consumption responses to cold weather shocks
 - o Controlling for historic and current small neighborhood characteristics

₀: Energy Inequity is in part the result of a *hysteresis* effect rooted in historic housing discrimination.

Redlining was a "critical juncture" that separated otherwise similar housing stock.

- Test by examining differences in home energy services quality between redlined and observably similar non-redlined households, measured as the
 - (1) presence of sufficient heating technology and
 - (2) energy consumption responses to cold weather shocks
 - Controlling for historic and current small neighborhood characteristics

Not addressed here

- Lending discrimination debatably ended with CRA in 1977. Households able to migrate, re-sort. Why does Energy Inequity persist?
- Test for "stickiness" of neighborhood.
 - High non-market moving costs.
 - Neighborhood support, family proximity, etc.

Historic data \rightarrow many assumptions

Prior literature

- Hoffman et al (2020) urban heat islands and redlined areas
- Nardone et al (2019) asthma and redlined areas
- Aaronson et al (2020) examined credit availability in redlined areas over 1930-1980 with RD-based analysis

Enlightening and incredibly inconvenient:

Fishback, La Voice, Shertzer, and Walsh (2020) on **endogeneity of redlining designation.**

- Used linked 1930 census address data and HOLC maps to show that redlined areas captured pre-existing economic and racial discontinuities in space.
- Border discontinuities not smooth in unobserveds. Even large moves in boundaries would still capture pre-existing segregations.
- Hillier (2003) no widespread proof that HOLC maps were distributed and used.

Empirical strategy

Acknowledging Fishback et al (2020), I control for selection on observables:

- Rent in 193X
- Income in 193X

- Presence of minorities in 193X
- Repair quality of housing in 193X

Assume:

- Conditional on observables that determined selection, Grade D (red) is as good as randomly assigned
- Unobserved neighborhood characteristics in 1930's not captured by observables are no longer relevant today.

Identification of effect of redlining using observably similar HOLC neighborhoods

- Multiple surveyors result in nearly arbitrary designation of Grade D (red) and Grade C (yellow) when "subversive minorities" were present.
- Many Grade C (yellow) areas had larger Black populations or worse home repair than nearby Grade D (red).

Analysis

Empirical strategy

Acknowledging Fishback et al (2020), I control for selection on observables:

- Rent in 193X
- Income in 193X

- Presence of minorities in 193X
- Repair quality of housing in 193X

Assume:

- Conditional on observables that determined selection, Grade D (red) is as good as randomly assigned
- Unobserved neighborhood characteristics in 1930's not captured by observables are no longer relevant today.

Identification of effect of redlining using observably similar HOLC neighborhoods

- Multiple surveyors result in nearly arbitrary designation of Grade D (red) and Grade C (yellow) when "subversive minorities" were present.
- Many Grade C (yellow) areas had larger Black populations or worse home repair than nearby Grade D (red).
- Drawback: leaning on linear controls.
 - Solution: very flexible with linear controls.

Measuring along two outcomes:

(1) Presence of sufficient heating technology in 2018

- Ask "are there currently differences in heating sources between redlined and near-redlined homes, controlling for selection on observables?"
- Substandard heating technology = Coal or "None"
- Requires spatially explicit heating fuel use

(2) Energy consumption responses to cold weather shocks

- Ask "are there currently differences in energy consumption responses to weather shocks between redlined and near-redlined homes, controlling for selection on observables?"
- Data on monthly consumption and heating degree days for households in Grade D / Grade C areas (12-19 months)
- Requires spatially explicit household electricity consumption with income

Data - Heating technology

HOLC from URichmond "Mapping Inequality"

- 196 cities, 8,877 neighborhoods
- Survey data processed
 - Grade A-B-C-D
 - Repair class
 - Median Income 1936
 - Mean rent 1936
 - Presence of Blacks 1936

2018 ACS at block-group

- 44,357 BGs intersect HOLC
 - Heating fuel
 - \circ Coal + "None" \rightarrow substandard
 - Racial distribution
 - Median income 2018

Data - Heating technology

HOLC from URichmond "Mapping Inequality"

- 196 cities, 8,877 neighborhoods
- Survey data processed
 - Grade A-B-C-D
 - Repair class
 - Median Income 1936
 - Mean rent 1936
 - Presence of Blacks 1936

Overlay BG with HOLC, keeping those BG that have >80% within one grade

- Take areal average when BG covers multiple HOLC neighborhoods of same grade
- 6,715 have most HOLC information

2018 ACS at block-group

- 44,357 BGs intersect HOLC
 - Heating fuel
 - Coal + "None" → substandard
 - Racial distribution
 - Median income 2018

Data - Hh Consumption

Measuring Hh response to temperature shocks

California RASS (Residential Appliance Saturation Survey)

- Confidential dataset with 24,216 homes surveyed in CA in 2009
 - Monthly consumption (from utility) for electricity, gas (if used)
 - Monthly HDD and CDD
 - Primary heating fuel
 - Income
 - Nighttime thermostat setpoint
 - Daytime thermostat setpoint
 - Zip code
- 138 households in 37 zip codes with >80% coverage for electric
- 1,018 households in 83 zip codes with >80% coverage for gas

Flexible fixed effect specification

$$PercentSubstandard_b = eta_0 + rac{oldsymbol{eta_g}}{g \in \{A,B,\ \}} + eta \mathbf{x}_b + \gamma_{c(b)} \mathbf{w_b} + \Gamma_{c(b)} + \epsilon_b$$

- ullet PercentSubstandard is share of 2018 homes with coal or no heating fuel in block-group b
- β_g is coefficient of interest
- x_b is repair class, presence of Blacks in 1936

- ullet $\Gamma_{c(b)}$ are county FEs for county c
- $\gamma_{c(b)}$ are county-specific slope shifters
- **w**_b
 - Median income in 1936, 2018
 - Mean rent 1935
 - Presence of Blacks in 1936

Result: Substandard Heating Tech.

Omitted Grade: C (Yellow) Omitted Race: White

Analysis: Hh Consumption

Response to temperature shocks

Home may have insufficient energy service quality if energy consumption responses to weather shocks are very large.

Analysis: Hh Consumption

Response to temperature shocks

Home may have insufficient energy service quality if energy consumption responses to weather shocks are very large.

- Consumption response is endogenous
- Both will have low consumption response to weather shocks:
 - Homes with efficient heating
 - Inefficient homes who meet budget constraints with conservative thermostat settings

Analysis: Hh Consumption

$$consumption_{ht} = eta_0 + eta_1 \qquad _{ht} + \qquad eta_g \cdot \qquad _{ht} \cdot 1(g = g(h)) \ = g \in \{A,B,\ \} \ + \qquad \beta_{ls} \qquad _{ht} \cdot 1(\ \ IG \ \ TSET_h = s) \cdot 1(ClimateZone_h = l) + \ = l = 1 \ + eta_{inc} \cdot \qquad _{ht} \cdot avgincome_h + \Gamma_h + arepsilon_{ht}$$

- $ullet consumption_{ht}$ is energy (kWh, therms) consumption for household h month t
- ullet g(h) is HOLC Grade g for h
- $ullet _{ht}$ is the heating-degree day for h in month t

- ullet IG $TSET_h$ is the thermostat setting for h
- $ullet ClimateZone_h$ is the climate type for h
- $income_h$ is reported income for h
- ullet Γ_h is household h fixed effect

Result: Hh Consumption

Omitted grade is "C"

Using only households with natural gas as primary heating fuel

Evidence of lingering differences in heating technology in/out of redlined areas

- Remains after controlling for observable differences in 193X
- Useful for targeting of energy efficiency programs

Evidence of larger consumption responses to cold weather shocks in redlined areas

- Conditional on 193X observables
- Conditional on thermostat setpoints

Further work

- Understanding selection into Grade D (red)
- "Stickiness" of redlined areas

Thanks!
